

Decision Partner for Human-Centred Agentic AI Decision-Support

Team Confused.de

18th Sep 2026

Introduction

Starting Point

Our initial group of seven divided into two groups due to different focus perspectives.

- Domain-specific start informs model.
- Generalisable model applied to domain-specific problems.

We opted to work on a generalisable framework for Human-Centred Agentic AI decision support. Many implementations of "human-centered" AI aren't actually human-centred whilst wasting human resources.

Objectives

Our primary objective is to design a framework for Human-Centred Agentic AI Decision Support. As a consequence the proposed system based on this framework should:

- Be partially automated.
- Use an Agentic AI structure with more than one active agent.
- Support meaningful decision making of the people using it.

As part of the framework we also seek to properly outline the limitations and expectations, with regards to:

- Human-Centred.
- Agentic AI.
- Decision support.

Definitional Discussion

Human-Centred

"**Human-Centred**, used to describe computers, technology, systems, etc. that are designed to work in ways that people can easily understand and learn." - Cambridge Dictionary.

Comments from our team:

- ① I don't know I am not a philosopher.
- ② Engaging people **throughout** the system, ie., humans in the loop.
- ③ AI has to be human-centred.
- ④ The AI agent's level of autonomy should be **predictable** and must respect the user's rights, **boundaries**, and preferences.

Agentic AI

"Agentic AI differs from traditional generative AI tools in that it has the autonomy and reasoning ability to act independently towards a goal." - Cambridge Dictionary.

Comments from our team:

- 1 Several AI doing things **automatically**.
- 2 AI agents operating **autonomously** while collaborating with one another.
- 3 AI agents working towards a specific goal with **limited human oversight**.
- 4 Never used it because I was worried about **uncontrolled** consequences.

Decision support

"A decision support system is a computer program that can arrange and sort large amounts of data, and that is used to help people in companies and organizations make important decisions based on the data" - Cambridge Dictionary.

Comments from our team:

- ① Decision support should be able to offer **trustworthy** insight that I haven't considered.
- ② A system **capable** of supporting my decision making.
- ③ At the end of the day you still make a decision with your gut.
- ④ For complex issues it should be a reasoning process and not direct action.
Support rather than action.

From Discussion to Metrics

What does the combined system, the Human-Centred Agentic AI Decision Support, look like?

- For the system to be Human-Centred, humans must be included throughout and the AI agents should interact with the humans in a predictable way with clear boundaries.
- The Agentic AI agents should act automatically, with a dynamic amount of autonomy offering control to the human users where it matters.
- The decision support offered should be trustworthy, capable and support action rather than take immediate action.

Metrics

Principle	Core metric	Example KPI
Human-Centred	Human involvement	% of critical workflow stages with human participation
	Boundary clarity	% of users correctly identifying agent capabilities/limits
	Behaviour predictability	% of interactions matching expected behaviour
	Human control	% of consequential actions that can be overridden

Metrics

Principle	Core metric	Example KPI
Dynamic Autonomy	Autonomous completion Autonomy appropriateness Escalation accuracy Intervention responsiveness	% of suitable tasks completed autonomously % of tasks with an appropriate autonomy level % of cases appropriately escalated to humans Median time to respond to human intervention

Metrics

Principle	Core metric	Example KPI
Trustworthy Decision Support	Decision accuracy	% of recommendations judged correct
	Evidence traceability	% of recommendations with traceable supporting evidence
	Actionability	% of recommendations users can act upon successfully
	Human decision quality	Change in decision quality with AI support
